The image shows a green printed circuit board (PCB) labeled 'R444A01 B'. It features a black digital display module with four red segments showing the numbers '23.88'. Below the display are two small circular components, likely temperature sensors. At the bottom of the PCB, there are four terminal blocks for power input: 'B-' (negative bus), 'R+' (positive bus), 'GND' (ground), and 'VIN' (voltage in). A white plastic mounting bracket is attached to the left side of the PCB. A three-wire ribbon cable connects the PCB to a black cylindrical external sensor. The background is a solid blue color.

Manufacture Aosong Datasheet Download AM2320 Datasheet Recommended third-party AM2320 Datasheet This little sensor looks an awful lot like the popular DHT11/DHT22 temperature and humidity sensors, but unlike classic DHT sensors, it has an I2C interface! That's right, you do not need to use a bit-bang timing-specific protocol to talk to the AM2320, it uses plain-old-I2C. Whew, that makes things a little easier, doesn't it? But! We'll let you know, this sensor is not well documented like our other, fancier I2C temperature & humidity sensors. The datasheet mentions it has 3% humidity accuracy and 0.5C temperature accuracy, but we're not very trusting of the specifications. So, while this sensor does seem to work, it's not recommended for anything where you care deeply about guaranteed accuracy. Temperature is probably correct to 2-3 degrees Celsius. Humidity is probably within 5-10%. That said, for maker and IoT projects? You can't beat the simplicity and price! And we've got ready-to-go working Arduino and CircuitPython code to use it. Check out our detailed guide for wiring diagrams, code, datasheet and more. Each order comes with one AM2320, a low-cost temperature and humidity sensor. You just provide any microcontroller that can run our Arduino or CircuitPython library, and two I2C pull-up resistors (not included).
